

# **FORKLIFT** SAFETY RULES FOR SMART MANAGERS

## **No tipping, flipping or turnovers**

Keep the forklift on all wheels. It's not useful on its side, upside down or lying sideways.

## **Don't drive into rack or pedestrians**

Rack tends to fall over or collapse when you drive into it. Not a great idea. Pedestrians tend to die. Also, not good.

## **Don't drop a load**

Unless you are in the can, don't drop your loads. They make a mess, damage things and people. People like you. And we mostly like you at Revival Engineers.

## **Don't lift a forklift with a forklift**

Forklifts are for lifting pallets, not other forklifts. So no forklift on forklift action, ok? Just sayin'.

## **That belty thing is there to save your ass... wear it - says Mr. Revival.**

Seatbelts help you not get bucked from your forky bronco. Wear them Ok.

## **A forklift is not an Uber**

No riders. No matter how much you like them or how pretty they smell.

## **When sh\*\* goes down, stay in the frickin' cabin**

That safety cage on the forklift is there to help you not die, when stuff is falling. Stay put.
